## POLE POSITIONS

## R. K. Headland, revised June 2022

Scott Polar Research Institute, University of Cambridge, Lensfield Road, Cambridge, United Kingdom, CB2 1ER [rkh10@cam.ac.uk](mailto:rkh10@cam.ac.uk) Four corresponding poles may be distinguished in the Arctic and in the Antarctic. The geographic pair are fixed and conjugate by definition (minor perturbations in position are known as the Chandler Wobble); those of inaccessibility are also defined by geography and very stable; the geomagnetic poles are mutually antipodean and wander slightly, depending on solar influences (the Geomagnetic Polar Axis is offset by approximately $9^{\circ}$ from the Geographic Polar Axis); while the magnetic poles are in comparatively rapid movement and may migrate through many kilometres during a brief period.

## North Geographic Pole $90^{\circ} \mathrm{N}$

## ARCTIC

A fixed location on the surface of the Arctic Ocean ( 690 km from the nearest land) which is the northern axis of rotation of the Earth. First seen by Roald Amundsen's expedition on 12 May 1926 from the airship Norge, first landing in 1948.

## North Magnetic Pole $\mathbf{8 6} \cdot \mathbf{4}^{\circ} \mathrm{N}$, $\mathbf{1 5 6} \cdot \mathbf{8}^{\circ} \mathbf{W}$ (January 2020)

A wandering location on the Earth's surface where conventional lines of magnetic force exit. The direction of the magnetic field is vertical, its strength is very variable. The north-seeking end of a compass needle, or any other magnet, is attracted towards this pole. It was first reached and determined by Captain James Ross on 1 June 1831 when it was at $70 \cdot 1^{\circ} \mathrm{N}, 96 \cdot 8^{\circ} \mathrm{W}$ much farther south on the Boothia Peninsula, a region with Eskimo inhabitants. Subsequently it has migrated north, currently it is on the central Arctic Ocean to the north-west of Prince Patrick Island and moving about 60 km annually on a course of $300^{\circ}$ towards Siberia. During events such as magnetic storms its diurnal motion may exceed 80 km .
North Geomagnetic Pole $80 \cdot 7^{\circ} \mathrm{N}, 72 \cdot 7^{\circ} \mathrm{W}$ (2022)
The north end of the axis of the resultant geomagnetic field which surrounds the Earth and extends into space forming the magnetosphere. This is where the electron flux from the Sun is concentrated and thus the focus for an auroral arc, a stratospheric torus where the Aurora Borealis is concentrated in the stratosphere approximately $23^{\circ}$ around this pole. It was determined in 1956 during the International Geophysical Year; it is off north-west Greenland, a region with Eskimo inhabitants. There are minor secular variations of its position.
Northern Pole of Inaccessibility $\mathbf{8 5} \cdot \mathbf{8 0}{ }^{\circ} \mathrm{N}, 176 \cdot \mathbf{1 5}^{\circ} \mathrm{E}$
The location on the surface of the Arctic Ocean, which is most distant from land; the most difficult location to attain, about 1008 km from any coast. Drift stations and aircraft have come close to this pole from the 1950 s but exact attainment is unrecorded.

## ANTARCTIC

## South Geographic Pole $90^{\circ}$ S

A fixed location on the surface of the Antarctic ice sheet (elevation 2835 m , and 1270 km from the nearest coast) which is the southern axis of rotation of the Earth. First attained on 14 December 1911 by Roald Amundsen's expedition from Norway. Occupied by 'AmundsenScott', a United States scientific station, from 1956.

South Magnetic Pole $\mathbf{6 4} \cdot \mathbf{1}^{\circ} \mathbf{S}, \mathbf{1 3 6} \cdot 9^{\circ} \mathbf{E}$ (January 2020)
A wandering location on the Earth's surface where conventional lines of magnetic force enter. The direction of the magnetic field is vertical its strength is very variable. The south-seeking end of a compass needle, or any other magnet, is attracted towards this pole. First attained during Ernest Shackleton's British Antarctic Expedition on 16 January 1909 when it was at $72 \cdot 4^{\circ} \mathrm{S}, 155 \cdot 3^{\circ} \mathrm{E}$, well inland beyond the Transantarctic Mountains. Subsequently it has migrated north, currently it is in the Southern Ocean, off Terre Adélie, and is moving about 14 km annually on a course of $310^{\circ}$. During events such as magnetic storms its diurnal motion may exceed 30 km .

## South Geomagnetic Pole $\mathbf{8 0 \cdot} \mathbf{7}^{\circ}$ S, $107 \cdot 3^{\circ} \mathbf{E}$ (2020)

The south end of the axis of the resultant geomagnetic field, which surrounds the Earth and extends into space forming the magnetosphere. This is where the electron flux from the Sun is concentrated and thus the focus for an auroral arc, a stratospheric torus where the Aurora Australis is concentrated in the stratosphere approximately $23^{\circ}$ around this pole. First attained by a Soviet Antarctic expedition, led by Vyacheslav Averyanov, on 16 January 1957 when 'Vostok', a scientific station, was established on the ice sheet ( 3488 m elevation). There are minor secular variations of its position.

## Southern Pole of Inaccessibility $\mathbf{8 3 \cdot 9 0}{ }^{\circ} \mathrm{S}, \mathbf{6 4 \cdot 8 8}{ }^{\circ}$ E

The location on the surface of the Antarctic ice sheet ( 3800 m elevation) which is most distant from the ocean; the most difficult location to attain, about 1300 km from any coast. First attained, 13 December 1958, by a Soviet Antarctic Expedition, led by Yevgeniy Tolstikov, which established a temporary scientific station in the vicinity, occupied during the 1958-59 austral summer. Its position may change about 1 km annually owing to calving of some of the great ice-sheets.

Mutual Distances on the Earth's surface

|  |  | Geographic | Magnetic | Geomagnetic | Inaccessibility |
| :--- | :--- | :---: | :---: | :---: | :---: |
| Arctic Poles | Geographic | - | 400 km | 1033 km | 467 km |
|  | Magnetic | 400 km | - | 1168 km | 213 km |
|  | Geomagnetic | 1033 km | 1168 km | - | 1278 km |
|  | Inaccessibility | 467 km | 213 km | 1278 km | - |
| Antarctic Poles | Geographic | - | 2878 km | 1033 km | 678 km |
|  | Magnetic | 2878 km | - | 2040 km | 2267 km |
|  | Geomagnetic | 1033 km | 2040 km | - | 701 km |
|  | Inaccessibility | 678 km | 2267 km | 701 km | - |

North to South distances: Geographic and Geomagnetic 20165 km , Magnetic 16975 km , Inaccessibility 19333 km
